UNIVERSITY™

## 2020 Survey of Aquatic Plant Species in Mississippi Waterbodies

Gray Turnage, Andrew Sample, and Colin McLeod

Mississippi State University, Geosystems Research Institute

### Executive Summary

#### Conclusions

- Only two lakes (George and Lower) and three rivers/creeks (Homochitto and Little Hatchie rivers and Hickahala creek) in this survey had a plant assemblages entirely composed of native aquatic and riparian plant species.
- There were 40 new plant species observed in the lake survey; of which, 6 were non-native species (all riparian).
- Overall, there were 119 aquatic and riparian plant species observed in the river/creek surveys; of which, 18 were non-native.
- Alligatorweed (*Alternanthera philoxeroides*: 7 waterbodies), water hyacinth (*Eichhornia crassipes*: 4 waterbodies), and Chinese tallow (*Triadica sebifera*: 4 waterbodies) were the most widespread non-native aquatic plant species found in lakes.
- Alligatorweed (*Alternanthera philoxeroides*: 14 waterbodies), Chinese tallow (*Triadica sebifera*: 7 waterbodies), and common reed (*Phragmites australis*: 5 waterbodies) were the most widespread non-native aquatic plant species found in rivers and lakes.

#### Recommendations

- Continue monitoring waterbodies within Mississippi for the presence of non-native aquatic plant species.
- Implement early detection, rapid response (EDRR) management options on populations of those non-native aquatic plant species known to be in Mississippi, specifically small isolated populations before they spread to other sites.
- Determine suitable goals for management of large populations of non-native aquatic plant species.
- Implement management strategies on those populations of native species that have grown to nuisance levels in Mississippi waterbodies.

## Introduction

The state of Mississippi (MS) has significant water resources that, many times, are impaired by invasive aquatic and wetland plant species. Impaired waterbodies can then act as source populations to introduce non-native vegetation to other waterbodies in the region. The likelihood of being a source population increases if the waterbody in question has a high frequency of boat traffic. Many times, small waterbodies that have significant amounts of boat traffic are overlooked due to the size of the waterbody. Approximately 192,050 acres of MS are covered by small waterbodies (<100 acres; Willis and Neal 2012) which is greater than the five largest reservoirs (117,840 acres; Ross Barnett, Sardis, Grenada, Enid, and Arkabutla reservoirs) in the state combined (USACE 2017). The state has more small waterbodies (> 160,000) and a greater density (1 per 0.51 mi<sup>2</sup>) of small waterbodies than any other state in the MidSouth (MS, AL, AR, TN, LA, and GA) region of the United States (Willis and Neal 2012).

Many waterbodies in the state that receive the highest amount of traffic are those owned and managed by the state of MS (via the Mississippi Department of Wildlife, Fisheries, and Parks - MDWFP). Other lakes that receive a significant amount of traffic are federal lakes operated by the US Fish and Wildlife Service (USFWS), the US Forest Service (USFS), or the US Army Corps of Engineers (USACE). Aside from state and federally operated waterbodies, there are also waterbodies that are operated by private entities (e.g. Pat Harrison Waterway District) or homeowners associations within the state. Many of these waterbodies are known to have problematic vegetation while others have never been surveyed.

Two federally listed noxious weeds have been found within the state: *Hydrilla verticillata* (Hydrilla or Waterthyme) and *Salvinia molesta* (giant salvinia). Additionally, torpedo grass (*Panicum repens*) is another invasive species that is listed on the MS noxious weed but not the federal list; torpedo grass is known to cause localized problems in the waterbodies it infests.

To date, only two statewide surveys of small and medium sized (100 – 7,500 acres) waterbodies in MS has been conducted within a single growing season (Turnage and Shoemaker 2018; Turnage et al. 2019). However, those surveys did not visit all the public waterbodies in the state in this size class. Additionally, only Turnage et al. (2019) surveyed any flowing system (Tennessee-Tombigbee Waterway) in MS. The purpose of this work was to survey small and medium sized lentic waterbodies and flowing (lotic) waterbodies (i.e., rivers and streams) for the presence of invasive or problematic aquatic vegetation that were not visited in 2017, 2019, or that warranted a revisit.

## Methodology

Water bodies were selected based on a combination of size, frequency of boat traffic, location within the state, and previous survey status. All waterbodies surveyed were within the geographic boundaries of the state of Mississippi. A total of 11 lakes and 33 rivers/streams (hereafter lotic waters) were surveyed from June through August 2020. Surveyed waterbodies were located across the state (Figures 1 and 2).

Lentic waterbodies were surveyed using a random walk (semi-quantitative) survey methodology. Survey points were taken by boat at intervals ranging from 150-2,000 m, depending on overall lake shoreline length (Figure 2). In general, increased length of shoreline resulted in increased distances between sampling points. Survey points were taken in the littoral zone of each waterbody, which was determined through Secchi readings (3 times the average secchi depth). At each survey point the GPS location and water depth were recorded. Plant assemblages at each point were documented via species presence for all aquatic plants (submersed rooted, floating leaved, emergent, and free-floating submersed growth forms; Sculthorpe 1967) along with certain macrophytic algae (i.e., *Nitella* spp., *Chara* spp.). All visible plants within 3.05 m (10 ft) of any part of the boat were recorded. At each survey point, a plant rake was deployed to determine the presence and identity of submersed plants. Plants that were observed on a waterbody but not within a sampling point were noted.

Lotic waterbodies were surveyed in one of two methods: boat surveys for larger or isolated systems (river deltas and coastal rivers) or shoreline assessment. Boat based survey methodology was similar to that used in lentic waters. Shoreline surveys were conducted by accessing boat launches and road crossings over lotic waters. At each survey point, a visual assessment was conducted for emergent and floating species along a stretch of shoreline and/or by deploying a plant rake for assessment of submersed species. Surveys of lotic waters were subdivided into eight of the 10 drainage basins listed in the MS Aquatic Invasive Species Management Plan (Loshbaugh et al. 2013); smaller drainages flowing to the Tennessee and Mississippi River Basins were not surveyed.

Species diversity and evenness were assessed and reported for lentic and lotic waterbodies (2 separate analyses; R Core Team 2020).

Plant identification followed Godfrey and Wooten (1981a, b) and naming is consistent with the USDA-PLANTS database (plants.usda.gov).

Species lists for each waterbody were compiled, including total points surveyed, percent of littoral zone vegetated, points present, and percent frequency per species and the native/non-native status of each species.

## **Results and Discussion**

### **Lentic Waters**

#### **Columbus Lake (USACE):**

Columbus Lake (33.52474, -88.47202) was surveyed from June 10-12, 2020. The three (3) most common species by presence were 1) *Taxodium distichum* (present at 50.9% of points), 2) *Zizaniopsis miliacea* (present at 50.9% of points), and 3) *Justicia americana* (present at 40.4% of points; Table 1). Non-native species (6 species) accounted for 14.3% of the 42 species observed. *Hydrilla verticillata*, a federal noxious weed, was not observed in Columbus Lake during this survey; however, it was observed in the lake by G. Turnage during the 2020 growing season as part of another project. *Salvinia molesta* (giant salvinia), another federal noxious weed, was observed in Columbus Lake at 8.8% survey points. *Panicum repens* (torpedograss), a state listed

noxious weed, was not observed at any points during this survey; but was observed elsewhere on the lake during the 2020 growing season. Torpedograss was found during the 2019 survey (Turnage et al. 2019). Of the 11 lakes surveyed, the Columbus Lake plant assemblage was the 2<sup>nd</sup> most diverse (42 species; Shannon-Weaver H Index) and ranked 5<sup>th</sup> in evenness.

#### Doyle Arm (USFS):

Doyle Arm Lake (33.272845, -88.790483) was surveyed on May 21, 2020. The most common species by presence were American white waterlily (present at 88.2% of points), watershield, American lotus, and bald cypress (each present at 58.8% of points; Table 2). Non-native species (3 species) accounted for 13.0% of the 23 species observed. The federal and state listed noxious weed Hydrilla was found at 1 survey point in Doyle Arm Lake. The aquatic invasive plant species brittle naiad (1 point) and Cuban bulrush (3 points) were also observed in Doyle Arm Lake. Of the 11 waterbodies surveyed, the Doyle Arm Lake plant assemblage was the 7<sup>th</sup> most diverse (23 species) and ranked 6<sup>th</sup> in evenness out of the 11 waterbodies surveyed.

#### Dalewood Shore (Private):

Dalewood Shore Lake (32.492671, -88.517768) was surveyed on June 19, 2020. The three (3) most common species by presence were 1) *Chara* (present at 32.3% of points), 2) *Paspalum spp.* (present at 29.0% of points), and 3) *Sacciolepis striata* & *Saururus cernuus* (each present at 25.8% of points; Table 3). Non-native species (4 species) accounted for 15.4% of the 26 species observed. Federal noxious weeds were not observed in Dalewood Shore Lake during this survey. Of the 10 waterbodies surveyed, the Dalewood Shore Lake plant assemblage was the 6<sup>th</sup> most diverse (26 species) and ranked 3<sup>rd</sup> in evenness out of the 11 waterbodies surveyed.

#### Horseshoe Lake (Private):

Horseshoe Lake (33.226083, -90.252542) was surveyed on June 26-30, 2020. The three (3) most common species by presence were 1) *Alternanthera philoxeroides* (present at 100% of points), 2) *Eichhornia crassipes* (present at 96.7% of points), 3) *Lemna minor* (present at 93.3% of points; Table 4). Non-native species (9 species) accounted for 23.7% of the 38 species observed. Federally and state listed noxious weeds were not observed in Horseshoe Lake. Horseshoe Lake ranked 5<sup>th</sup> in diversity (38 species; Shannon-Weaver H Index) and 10<sup>th</sup> in evenness out of the 11 waterbodies surveyed.

#### Lake George (Private):

Lake George (32.736873, -90.609116) was surveyed on July 1, 2020. The three (3) most common species by presence were 1) *Carya aquatica* (a riparian species present at 62.5% of points), 2) *Planera aquatica* (a riparian species present at 60.0% of points), 3) and *Foresteria acuminata* (another riparian species present at 47.5% of points; Table 5). Only native plant

species were observed in Lake George. Lake George ranked 10<sup>th</sup> in diversity (13 species; Shannon-Weaver H Index) and 7<sup>th</sup> in evenness out of the 11 waterbodies surveyed.

#### Little Eagle Lake (MDWFP):

Little Eagle Lake (33.140157, -90.360045) was surveyed on June 23, 2020. The three (3) most common species by presence were 1) *Eichhornia crassipes* (present at 100% of points), 2) *Nyssa aquatica* (a riparian species present at 88.9% of points), 3) and *Taxodium distichum* (present at 77.8% of points; Table 6). Non-native species (3 species) accounted for 50.0% of the 6 species observed. State and federally listed noxious weeds were not observed in Little Eagle Lake. Little Eagle Lake ranked 11<sup>th</sup> in diversity (6 species; Shannon-Weaver H Index) and 2<sup>nd</sup> in evenness out of the 11 waterbodies surveyed.

#### Lower Lake (USACE):

Lower Lake (34.406687, -89.803517) catches the tailwaters below Sardis Lake and was surveyed on June 22, 2020. The three (3) most common species by presence were 1) *Polygonum hydropiperoides* (present at 45.5% of points), 2) *Juncus effusus* (present at 36.4% of points), and 3) *Cephalanthus occidentalis* & *Sesbania herbacea* (each present at 31.8% of points; Table 7). Non-native species were not observed in Lower Lake. Lower Lake ranked 1<sup>st</sup> in diversity (46 species; Shannon-Weaver H Index) and 1<sup>st</sup> in evenness out of the 11 waterbodies surveyed.

#### Okatibbee Lake (MDWFP):

Lake Okatibbee (32.521112, -88.807738) was surveyed on June 16-17, 2020. The three (3) most common species by presence were 1) *Leersia oryzoides* (present at 86.6% of points), 2) *Alternanthera philoxeroides* (present at 71.6% of points), and 3) *Cephalanthus occidentalis* (present at 52.2% of points; Table 8). Non-native species (3 species) accounted for 7.7% of the 39 species observed in Lake Okatibbee. Lake Okatibbee ranked 4<sup>th</sup> in diversity (39 species; Shannon-Weaver H Index) and last in evenness out of the 11 waterbodies surveyed.

#### Roebuck Lake (USACE):

Roebuck Lake (33.479596, -90.269456) was surveyed on June 24-26, 2020. The three (3) most common species by presence were 1) *Taxodium distichum* (present at 92.0% of points), 2) *Planera aquatica* (a riparian species present at 56.0% of points), and 3) *Cephalanthus occidentalis* (present at 48.0% of points; Table 9). Non-native species (2 species) accounted for 11.8% of the 17 species observed. Roebuck Lake ranked 8<sup>th</sup> in diversity (17 species; Shannon-Weaver H Index) and 8<sup>th</sup> in evenness out of the 11 waterbodies surveyed.

### Trace State Park Lake (MDWFP):

Trace State Park Lake (34.255036, -88.889951) was surveyed from June 15, 2020. The three (3) most common species by presence were 1) *Juncus effusus* (present 63.6% of points), 2) *Leersia oryzoides* (present at 57.6% of points), and 3) *Paspalum spp.* (a riparian species present at 42.4% of points; Table 10). Non-native species were not observed in Trace State Park Lake; it should be noted that many riparian species were located in the lake due to the recent drawdown that allowed these species to establish in habitat not normally suited for them. It is likely that the plant community of Trace State Park Lake will change significantly over the next year. Repeated surveys of this lake should be conducted to document this change. The lake at Trace State Park ranked 3<sup>rd</sup> in diversity (30 species; Shannon-Weaver H Index) and 4<sup>th</sup> in evenness out of the 11 waterbodies surveyed.

### Wasp Lake (Private):

Wasp Lake (33.235523, -90.483924) was surveyed from June 24-25, 2020. The three (3) most common species by presence were 1) *Carya aquatica*, 2) *Foresteria acuminata* (each a riparian species present at 73.7% of points), and 3) *Brunnichia ovata* (a riparian species present at 44.7% of points; Table 11). Non-native species (1 species) accounted for 5.8% of the 17 species observed. Wasp Lake ranked 9<sup>th</sup> in diversity (17 species; Shannon-Weaver H Index) and 9<sup>th</sup> in evenness out of the 11 waterbodies surveyed.

## Lotic Waters

### North Independent Streams Basin (NISB):

*Hatchie River:* The Hatchie river rises in Union county, MS and flows north into TN; its tributary, the Little Hatchie river, joins it near Ripley in Tippah county, MS. Aquatic and riparian vegetation was surveyed at 4 points along the Hatchie River in Union, Tippah, and Alcorn counties, MS. The Hatchie river had a total of 16 plant species present; 2 of which were non-native riparian species (yellow nutsedge and Johnson grass). The most prevalent aquatic plants were Pennsylvania smartweed (75% of survey points) and American water willow (50% of points; Table 12). No true aquatic invasive plants were found at survey sites along the Hatchie river or the Little Hatchie River. The Hatchie river ranked 10<sup>th</sup> in diversity (16 species; Shannon-Weaver H Index) and 6<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Little Hatchie River:* Aquatic and riparian vegetation were surveyed at 3 points on the Little Hatchie river in Tippah county, MS. A total of 10 species encountered, all of which are native to MS. The most common aquatic plants were spike rush and lizards' tail (each found at 33.3 % of points; Table 12). The Little Hatchie river ranked 22<sup>nd</sup> in diversity (10 species; Shannon-Weaver H Index) and 13<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Summary:* No aquatic invasive plant species were encountered in the NISB. However, vegetation was only surveyed at 7 points across the basin on the Hatchie and Little Hatchie rivers due to a lack of access points to either river.

#### Yazoo River Drainage Basin (YRDB):

*Yazoo River:* The Yazoo river is formed in Leflore county near Greenwood, MS where the Yalobusha and Tallahatchie rivers converge; the other major tributary of the Yazoo is the Sunflower river. Vegetation was surveyed at 5 points along the Yazoo river between Greenwood and Vicksburg, MS. A total of 13 aquatic and riparian plant species were encountered on the Yazoo; of which, 4 are non-native to MS (alligatorweed, yellow nutsedge, water hyacinth, and Johnson grass; Table 13). Alligatorweed (aquatic) and yellow nutsedge (riparian) were the most commonly encountered species (each found at 60% of survey points; Table 13). The Yazoo river ranked 17<sup>th</sup> in diversity (13 species; Shannon-Weaver H Index) and 20<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Yalobusha River:* The Yalobusha river is a tributary of the Yazoo river and rises in Chickasaw county, MS and flows through Calhoun, Grenada, and Leflore counties, MS. Near Grenada, MS the river has been impounded to form Grenada Lake which covers parts of Grenada and Calhoun counties, MS. Grenada Lake is one of 4 major flood control reservoirs in MS. The Grenada Lake impoundment also captures the flow of the Skuna river which is a tributary to the Yalobusha. Vegetation was surveyed at 6 points along the Yalobusha river; a total of 18 species were recorded with only 2 non-native riparian species recorded (Table 14). No invasive aquatic plants were encountered at points along the Yalobusha river or its tributary, the Skuna river (Table 14). The Yalobusha river ranked 7<sup>th</sup> in diversity (18 species; Shannon-Weaver H Index) and 5<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Skuna River:* The Skuna river rises near Pontotoc, MS and flows through Chickasaw and Calhoun counties, MS; it flows into Grenada Lake in Calhoun county, MS. Vegetation was surveyed at 3 points along the Skuna river; 6 species were encountered with only 1 non-native riparian species recorded (Table 14). No aquatic invasive plant species were encountered along the Skuna river. The Skuna river ranked 32<sup>nd</sup> in diversity (6 species; Shannon-Weaver H Index) and 26<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Tallahatchie River:* The Tallahatchie river is a tributary of the Yazoo that forms at the confluence of the Little Tallahatchie and Coldwater rivers south of Marks, MS. Two points were surveyed for aquatic and riparian vegetation along the Tallahatchie river with only one non-native riparian species (yellow nutsedge) found at one survey point (Table 15). No aquatic invasive species were observed on the Tallahatchie or Little Tallahatchie rivers; however, the invasive aquatic plant alligatorweed was present in the Yocona river. The Tallahatchie river ranked 33<sup>rd</sup> in diversity (5 species; Shannon-Weaver H Index) and 7<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Little Tallahatchie River:* The Little Tallahatchie river rises in Tippah county, MS and flows through Union, Marshall, Lafayette, Panola, and Tallahatchie counties, MS. The Little Tallahatchie was impounded near Batesville, MS to form Sardis Lake that covers parts of Panola and Lafayette counties, MS; Sardis Lake is one of the 4 major flood control reservoirs in MS. The Yocona river is a tributary that converges with the Little Tallahatchie near Crowder, MS. Vegetation was surveyed at 8 points along the Little Tallahatchie; only 2 non-native riparian species (yellow nutsedge and Johnson grass) were documented on the Little Tallahatchie (Table 15). The Little Tallahatchie river ranked 8<sup>th</sup> in diversity (19 species; Shannon-Weaver H Index) and 22<sup>nd</sup> in evenness out of the 33 rivers/streams surveyed.

*Yocona River:* The Yocona river is a tributary of the Little Tallahatchie river. The Yocona river was impounded near Enid, MS to form Enid Lake that covers parts of Panola, Yalobusha, and Lafayette counties, MS. Enid Lake is one of the 4 major flood control reservoirs in MS. Aquatic and riparian vegetation was surveyed at 6 points on the Yocona river. Three non-native riparian species and the aquatic invasive plant alligatorweed were present in the Yocona; alligatorweed was found at 33.3% of survey points (Table 16). The Yocona river ranked 5<sup>th</sup> in diversity (20 species; Shannon-Weaver H Index) and 19<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Coldwater River:* The Coldwater river rises in Marshall county, MS and flows through Benton, DeSoto, Tate, Tunica, and Quitman counties. The Coldwater river was impounded near Arkabutla, MS to form Arkabutla Lake, one of the 4 major flood control reservoirs in MS. Arkabutla Lake also captures water from Hurricane and Hickahala creeks which are two tributaries of the Coldwater river. Vegetation was surveyed at 7 points along the Coldwater river. A total of 17 species were observed on the Coldwater with only 2 non-native riparian species recorded (Table 17). No aquatic invasive species were observed along the Coldwater river or its tributaries. The Coldwater river ranked 9<sup>th</sup> in diversity (17 species; Shannon-Weaver H Index) and 10<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Hurricane Creek:* Hurricane creek flows into the north end of Arkabutla Lake; the historic confluence of Hurricane Creek and the Coldwater river now lies under Arkabutla Lake. Vegetation was surveyed at 3 points along Hurricane creek; a total of 12 species were recorded with only 2 non-native riparian species observed (Table 18). Hurricane creek ranked 18<sup>th</sup> in diversity (12 species; Shannon-Weaver H Index) and 17<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Hickahala Creek:* Hickahala creek joins the Coldwater river from the South a few miles before the Coldwater flows into Arkabutla Lake.

Vegetation was surveyed at 3 points along Hickahala creek; a total of 10 species were recorded with no non-native species observed (Table 18). Hickahala creek ranked 21<sup>st</sup> in diversity (10 species; Shannon-Weaver H Index) and 12<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Sunflower River:* The Sunflower river rises in DeSoto county, MS and flows south through Tunica, Coahoma, Sunflower, Bolivar, Washington, Humphreys, Sharkey, and Yazoo counties before joining the Yazoo river near Holly Bluff, MS. Vegetation was surveyed at 5 points along the Sunflower river. A total of 9 species were recorded on the Sunflower river; of which, 1 was a non-native riparian species and another was the aquatic invasive plant species alligatorweed that was found at 80% of the survey points (Table 19). The Sunflower river ranked 26<sup>th</sup> in diversity (9 species; Shannon-Weaver H Index) and 30<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Summary:* A total of 48 points were surveyed for aquatic vegetation in the YRDB. The aquatic invasive plant species alligatorweed and water hyacinth were recorded in the YRDB. Alligatorweed was found at 19% of survey points (9 points) in the YRDB and was present in the main stem of Yazoo river and its tributaries the Yocona and Sunflower rivers. Water hyacinth was found at 2% of survey points (1 point) in the YRDB along the main stem of the Yazoo river.

#### Tombigbee River Drainage Basin (TRDB):

*Buttahatchee River:* The Buttahatchee river rises in Alabama and flows into MS in Monroe county and continues through Monroe and Lowndes counties where it historically joined the Tombigbee river from the East. The historic confluence of the Tombigbee and Buttahatchee rivers is now part of the riverine section of Lake Columbus on the Tennessee-Tombigbee Waterway (TTW). Vegetation was surveyed at 4 points along the Buttahatchee river in MS. A total of 10 species were recorded on the Buttahatchee river; of which, 1 was a non-native riparian species (Table 20). There were no invasive aquatic plant species encountered at any survey points for this work; however, alligatorweed and water hyacinth have both been observed in the Buttahatchee in the past (Turnage, personal observation). The Buttahatchee river ranked 24<sup>th</sup> in diversity (10 species; Shannon-Weaver H Index) and 23<sup>rd</sup> in evenness out of the 33 rivers/streams surveyed.

*Town Creek:* Town creek is a tributary of the Tombigbee river; it now joins the TTW from the west side of Aberdeen Lake in Monroe county, MS. Vegetation was surveyed at 3 points along Town creek. A total of 10 species were recorded in Town creek (Table 20). One non-native riparian and one invasive aquatic plant (Cuban bulrush) were recorded in Town creek; Cuban bulrush was present at 33.3% of survey points (Table 21). Town creek ranked 25<sup>th</sup> in diversity (10 species; Shannon-Weaver H Index) and 24<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Chiwapa Creek:* Chiwapa creek is a tributary of Town creek; the 2 converge near the town of Nettleton in northeast MS. Vegetation was surveyed at 3 points along Chiwapa

creek. A total of 7 riparian and aquatic plant species were recorded on Chiwapa creek; of these 7 only one non-native riparian species was recorded (Johnson grass; Table 21). No aquatic invasive plant species were recorded along Chiwapa creek. Chiwapa creek ranked 29<sup>th</sup> in diversity (7 species; Shannon-Weaver H Index) and 29<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Tibbee Creek:* Tibbee creek rises near West Point in Clay county MS and joined the Tombigbee from the west near Columbus, MS. The historic confluence is now part of Columbus Lake on the TTW. Vegetation was surveyed at 3 points along Tibbee creek; two non-native riparian plant species (mimosa and yellow nutsedge) were recorded along Tibbee creek (Table 22). No aquatic invasive plant species were recorded during this survey; however, the aquatic invasive plants hydrilla, water hyacinth, alligatorweed, and Cuban bulrush have been observed in the lower reaches of Tibbee creek (Turnage, personal observation). Tibbee creek ranked 28<sup>th</sup> in diversity (7 species; Shannon-Weaver H Index) and 8<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Line Creek:* Line creek is a tributary that joins Tibbee creek near West Point, MS. Aquatic and riparian vegetation was surveyed at 1 point on Line creek. A total of 6 species were recorded on Line creek; one of which was a non-native riparian species and two of which were aquatic invasive species (alligatorweed and common reed; Table 22). Line creek ranked 30<sup>th</sup> in diversity (6 species; Shannon-Weaver H Index) and was one of two flowing waters that ranked 1<sup>st</sup> in evenness (the Homochitto river being the other) out of the 33 rivers/streams surveyed.

*Luxapallila Creek:* Luxapallila creek rises in Alabama and flows into Lowndes county, MS. Luxapallila creek historically joined the Tombigbee river from the east at Columbus, MS; the confluence is now part of the riverine section at the northern end of Aliceville, Lake on the TTW. Aquatic and riparian vegetation was surveyed at 5 points along Luxapallila creek (Table 22). A total of 15 species were observed along Luxapallila creek; of which, 11 were native plant species, 3 were non-native riparian species, and one was the aquatic invasive plant species alligatorweed which was present at 40% of survey points (Table 23). Luxapallila creek ranked 13<sup>th</sup> in diversity (15 species; Shannon-Weaver H Index) and 14<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Summary:* A total of 19 points were surveyed for aquatic vegetation in the TRDB. The aquatic invasive plant species alligatorweed, Cuban bulrush, and common reed were recorded in the TRDB; additionally, the aquatic invasive species water hyacinth, torpedograss, wild taro, giant salvinia, common salvinia, hydrilla, and parrots feather are known to be in the TRDB (Turnage, personal observation). Alligatorweed was found at 16% of survey points (3 points) in the TRDB and was observed in Line and Luxapallila creeks. Cuban bulrush was found at one point on Town creek and common reed was found at one point on Line creek (5% of survey points for each species in the TRDB).

### Big Black River Drainage Basin:

*Big Black River:* The Big Black river rises in Webster county, MS and flows through Choctaw, Montgomery, Carrol, Attala, Holmes, Yazoo, Madison, Hinds, Warren, and Claiborne counties where it flows into the Mississippi river south of Vicksburg, MS. Vegetation was surveyed at 4 points along the Big Black river. A total of 10 aquatic and riparian species were recorded along the Big Black. Two non-native riparian species and the aquatic invasive species alligatorweed were recorded in the Big Black river (Table 24). Alligatorweed was present at 50% of the points surveyed. The Big Black river ranked 23<sup>rd</sup> in diversity (10 species; Shannon-Weaver H Index) and 18<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

#### Pearl River Drainage Basin (PRDB):

*Pearl River:* The Pearl river rises in Neshoba county, MS and flows through Leake, Scott, Madison, Rankin, Hinds, Copiah, Simpson, Lawrence, Marion, Pearl River, and Hancock counties in MS where it empties into the Gulf of Mexico. Aquatic and riparian vegetation was surveyed at 6 points along the Pearl river. A total of 14 plant species were recorded at survey points; none of the recorded species were aquatic invasive species and only one was a non-native riparian species (Table 25). However, this river system is known to be impacted by water hyacinth, hydrilla, alligatorweed, torpedograss, common reed, and giant salvinia (Turnage, personal observation). The Pearl river ranked 15<sup>th</sup> in diversity (14 species; Shannon-Weaver H Index) and 15<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Bogue Chitto River:* The Bogue Chitto river rises in Lincoln county, MS and flows south through Pike county, MS and then into Louisiana before joining the Pearl river from the west near Picayune, MS. Riparian and aquatic vegetation were surveyed at 4 points along the Bogue Chitto river in MS. A total of 10 native plant species were observed while one invasive aquatic plant species (Wild taro) was observed at 50% of survey points (Table 25). The Bogue Chitto river ranked 19<sup>th</sup> in diversity (11 species; Shannon-Weaver H Index) and 16<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Pearl River Delta:* The Pearl river divides the southern reaches of the states of Mississippi and Louisiana. The mouth of the Pearl river at the Gulf of Mexico has is an extensive delta complex of braded channels, bayous, and canals. network where it flows into the Gulf of Mexico. Because of the transition from fresh, to brackish, to salt water environments this region has a very high diversity of aquatic and riparian plant species. Vegetation in the MS portion of the Pearl river delta was surveyed by boat. A total of 48 aquatic and riparian species were recorded across 17 survey points; of which, 7 were aquatic invasive species (alligatorweed – 47% of survey points, water hyacinth – 18%, Eurasian watermilfoil – 53%, brittle naiad – 24%, torpedo grass – 11%, common reed – 59%, and common salvinia – 53%; Table 26). The Pearl river delta ranked 1<sup>st</sup> in diversity (48 species; Shannon-Weaver H Index) and 27<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Summary:* A total of 27 points were surveyed for aquatic vegetation in the PRDB. The aquatic invasive plant species alligatorweed, water hyacinth, Eurasian watermilfoil, brittle naiad, torpedo grass, common reed, common salvinia, and wild taro were observed in the PRDB. Alligatorweed

was found at 30% of survey points (8 points) in the PRDB and was observed in the Pearl river delta. Water hyacinth was found at 11% of survey points (3 points) in the PRDB and was observed in the Pearl river delta. Eurasian watermilfoil was found at 33% of survey points (9 points) in the PRDB and was observed in the Pearl river delta. Brittle naiad was found at 15% of survey points (4 points) in the PRDB and was observed in the Pearl river delta. Torpedo grass was found at 7% of survey points (2 points) in the PRDB and was observed in the Pearl river delta. Common reed was found at 37% of survey points (10 points) in the PRDB and was observed in the Pearl river delta. Common salvinia was found at 33% of survey points (9 points) in the PRDB and was observed in the Pearl river delta. Wild taro was found at 7% of survey points (2 points) in the PRDB and was observed in the Bogue Chitto river.

#### South Independent Streams Basin (SISB):

*Homochitto River:* The Homochitto river rises in Copiah county, MS and flows through Lincoln, Franklin, Amite, Wilkinson, and Adams counties before emptying into the Mississippi river south of Natchez, MS. Aquatic and riparian vegetation were surveyed at 3 points along the Homochitto river. A total of 7 species were observed; of which, no aquatic invasive species were recorded (Table 27). The Homochitto river ranked 27<sup>th</sup> in diversity (7 species; Shannon-Weaver H Index) and was one of two flowing waters that ranked 1st in evenness (Line creek being the other) out of the 33 rivers/streams surveyed.

#### Pascagoula River Drainage Basin (PARDB):

*Pascagoula River:* The Pascagoula river is formed in George county, MS where the Leaf and Chickasawhay rivers converge and flows south through Jackson county to the Gulf of Mexico. Aquatic and riparian vegetation were surveyed at 4 points along the Pascagoula river. A total of 15 plant species were recorded; of which, two were non-native riparian species (yellow nutsedge and Johnson grass) and two were aquatic invasive species (alligatorweed and Chinese tallow; Table 28). Alligatorweed and Chinese tallow were each recorded at 25% of the points surveyed (Table 28). The Pascagoula river ranked 11<sup>th</sup> in diversity (15 species; Shannon-Weaver H Index) and 3<sup>rd</sup> in evenness out of the 33 rivers/streams surveyed.

*Chickasawhay River:* The Chickasawhay river is formed by the confluence of the Chunky and Okatibbee rivers in Clarke county, MS. The Chickasawhay river flows through Wayne, Greene, and George counties where it joins the Leaf river to form the Pascagoula river. Riparian and aquatic vegetation was surveyed at 4 points on the Chickasawhay river. A total of 12 plant species were observed; of which, one non-native riparian species (mimosa) and one aquatic invasive species (alligatorweed) were recorded at 25% of survey points, respectively (Table 29). The Chickasawhay river ranked 20<sup>th</sup> in diversity (12 species; Shannon-Weaver H Index) and 21<sup>st</sup> in evenness out of the 33 rivers/streams surveyed.

*Chunky River:* The Chunky river rises in Newton county, MS and flows through Lauderdale and Clarke county where it converges with the Okatibbee river to

form the Chickasawhay river. Riparian and aquatic vegetation was surveyed at 2 points on the Chunky river. A total of 6 plant species were observed; of which, one aquatic invasive species (alligatorweed) was recorded at 50% of survey points (one point; Table 30). The Chunky river ranked 31<sup>st</sup> in diversity (6 species; Shannon-Weaver H Index) and 4<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Okatibbee River:* The Okatibbee river flows out of Okatibbee Lake in Lauderdale county; Okatibbee Lake was formed by impounding Okatibbee creek and other tributary creeks of the Okatibbee river. The Okatibbee river flows through Clarke county where it converges with the Chunky river to form the Chickasawhay river. Riparian and aquatic vegetation was surveyed at 4 points on the Okatibbee river. A total of 14 plant species were observed; of which, 2 are aquatic invasive species (alligatorweed and Chinese tallow; Table 30). Each aquatic invasive species was recorded 25% of the points surveyed (Table 30). The Okatibbee river ranked 14<sup>th</sup> in diversity (14 species; Shannon-Weaver H Index) and 9<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Leaf River:* The Leaf river rises in Scott county, MS and flows through Smith, Covington, Jones, Forrest, Perry, Greene, and George counties where it converges with the Chickasawhay river to form the Pascagoula river. Riparian and aquatic vegetation was surveyed at 5 points on the Leaf river. A total of 13 plant species were observed; of which, one non-native riparian species (Johnson grass) and 3 aquatic invasive species (alligatorweed, wild taro, and Chinese tallow) were recorded (Table 30). Alligatorweed was found at 40% of survey points, while wild taro and Chinese tallow were each found at 20% of survey points (Table 31). The Leaf river ranked 16<sup>th</sup> in diversity (13 species; Shannon-Weaver H Index) and 11<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Pascagoula River Delta:* The Pascagoula river delta is in Jackson county, MS where the Pascagoula river flows into the Gulf of Mexico. The river delta follows a gradient from north to south of fresh, brackish, and salt water and therefore has a high plant diversity due plant adaptations for each water salinity environment. Vegetation in the Pascagoula river delta was surveyed by boat. A total of 39 aquatic and riparian species were recorded across 16 survey points; of which, 8 were aquatic invasive species (alligatorweed – 25% of survey points, water hyacinth – 63%, Eurasian watermilfoil – 44%, common reed – 38%, common salvinia – 6%, giant salvinia – 69%, scarlet sesbania – 19%, and Chinese tallow – 6%; Table 32). Parrotfeather has also been observed in the Pascagoula river delta (M. Pursley, personal observation). The Pascagoula river delta ranked 4<sup>th</sup> in diversity (39 species; Shannon-Weaver H Index) and 33<sup>rd</sup> in evenness out of the 33 rivers/streams surveyed.

*Summary:* A total of 35 points were surveyed for aquatic and riparian vegetation in the PARDB. The aquatic invasive plant species alligatorweed, water hyacinth, Eurasian watermilfoil, common reed, common salvinia, giant salvinia, scarlet sesbania, wild taro, and Chinese tallow were observed in the PARDB. Alligatorweed was found at 29% of survey points (10 points) in the

PARDB and was observed in every water body surveyed. Water hyacinth, Eurasian watermilfoil, and giant salvinia were each found at 3% of survey points (1 point) in the PARDB and were observed in the Pascagoula river delta. Common reed was found at 9% of survey points (3 points) in the PARDB and was observed in the Okatibbee river and the Pascagoula river delta. Common salvinia was found at 9% of survey points (3 points) in the PARDB and was observed in the Pascagoula river delta. Scarlet sesbania was found at 9% of survey points (3 points) in the PARDB and was observed in the Pascagoula river delta. Wild taro was found at 3% of survey points (1 point) in the PARDB and was observed in the Leaf river. Chinese tallow was found at 11% of survey points (4 points) in the PARDB and was observed in the Pascagoula, Okatibbee, and Leaf rivers as well as the Pascagoula river delta.

#### Coastal Streams Drainage Basin (CSDB):

*Jourdan River:* The Jourdan river rises in Hancock county, MS and flows into the western side of the Bay of St. Louis on the Gulf of Mexico. Aquatic and riparian vegetation was surveyed by boat at 10 points on the Jourdan river. A total of 17 plant species were observed; of which, 2 are aquatic invasive species (common reed and Chinese tallow; Table 33). Common reed and Chinese tallow were found at 30 and 10% of survey points, respectively (Table 33). Common salvinia has also been observed in the Jourdan river (M. Pursley, personal communication). The Jourdan river ranked 12<sup>th</sup> in diversity (17 species; Shannon-Weaver H Index) and 32<sup>nd</sup> in evenness out of the 33 rivers/streams surveyed.

*Wolf River:* The Wolf river rises in Pearl River county, MS and flows through Hancock and Harrison counties where it flows into the eastern side of the Bay of St. Louis on the Gulf of Mexico. Aquatic and riparian vegetation was surveyed by boat at 12 points on the Wolf river. A total of 21 plant species were observed; of which, 2 are aquatic invasive species (common salvinia and Chinese tallow; Table 34). Common salvinia and Chinese tallow were found at 58 and 25% of survey points, respectively (Table 34). The Wolf river ranked 6<sup>th</sup> in diversity (21 species; Shannon-Weaver H Index) and 31<sup>st</sup> in evenness out of the 33 rivers/streams surveyed.

*Biloxi River:* The Biloxi river rises in Stone county, MS and flows through Harrison county to the Back Bay of Biloxi on the Gulf of Mexico. Aquatic and riparian vegetation was surveyed by boat at 12 points on the Biloxi river. A total of 39 plant species were observed; of which, one is a non-native riparian species (Chinese privet) and one is an aquatic invasive species (torpedo grass; Table 35). Torpedo grass was found at 36% of survey points (Table 35). The Biloxi river ranked 3<sup>rd</sup> in diversity (39 species; Shannon-Weaver H Index) and 28<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Tchoutacabuffa River:* The Tchoutacabuffa river rises in Harrison county and flows into the northern end of the Back Bay of Biloxi on the Gulf of Mexico. Aquatic and riparian vegetation was surveyed by boat at 14 points on the Tchoutacabuffa river. A total of 46 plant species were observed; of which, two are non-native riparian species (English holly and camphor tree) and 4 are aquatic invasive species (alligatorweed, torpedo grass, scarlet sesbania, and Chinese tallow; Table 36). Alligatorweed, torpedo grass, scarlet sesbania, and Chinese tallow were found at 21,

57, 21, and 14% of survey points, respectively (Table 36). The Tchoutacabuffa river ranked 2<sup>nd</sup> in diversity (46 species; Shannon-Weaver H Index) and 25<sup>th</sup> in evenness out of the 33 rivers/streams surveyed.

*Summary:* A total of 48 points were surveyed for aquatic and riparian vegetation in the CSDB. The aquatic invasive plant species alligatorweed, common reed, common salvinia, scarlet sesbania, torpedo grass, and Chinese tallow were observed in the CSDB. Alligatorweed and scarlet sesbania were each found at 6% of survey points (3 points) in the CSDB and were observed in the Tchoutacabuffa river. Common reed was found at 6% of survey points (3 points) in the CSDB and was observed in the Jourdan river. Common salvinia was found at 15% of survey points (7 points) in the CSDB and was observed in the Wolf river. Torpedo grass was found at 27% of survey points (13 points) in the CSDB and was observed in the Biloxi and Tchoutacabuffa rivers. Chinese tallow was found at 13% of survey points (6 points) in the CSDB and was observed in the Jourdan, Wolf, and Tchoutacabuffa rivers.

### **Total Survey:**

In total, 106 distinct species were encountered in lakes (Table 37) and 119 in the rivers and streams survey (Table 38); however, these are not comprehensive lists of plant species known to occur at aquatic locations in MS. Some species were only identified to the taxonomic level of Genus. Of the 11 lakes surveyed (Table 39), only two had plant assemblages composed entirely of native aquatic plant species: Lake George and Lower Lake. Only three rivers and streams had plant assemblages composed entirely of native aquatic plant species: Homochitto river, Little Hatchie river, and Hickahala creek (Table 40). In total, 559 points were surveyed across 11 lakes and 33 rivers and streams in MS. The federal noxious weed hydrilla was observed in Doyle Arm Lake for the first time during this survey.

### **Conclusions**

- Only two lakes (George and Lower) and three rivers/creeks (Homochitto and Little Hatchie rivers and Hickahala creek) in this survey had a plant assemblages entirely composed of native aquatic and riparian plant species.
- There were 40 new plant species observed in the lake survey; of which, 6 were non-native species (all riparian).
- Overall, there were 119 aquatic and riparian plant species observed in the river/creek surveys; of which, 18 were non-native.
- Alligatorweed (*Alternanthera philoxeroides*: 7 waterbodies), water hyacinth (*Eichhornia crassipes*: 4 waterbodies), and Chinese tallow (*Triadica sebifera*: 4 waterbodies) were the most widespread non-native aquatic plant species found in lakes.
- Alligatorweed (*Alternanthera philoxeroides*: 14 waterbodies), Chinese tallow (*Triadica sebifera*: 7 waterbodies), and common reed (*Phragmites australis*: 5 waterbodies) were the most widespread non-native aquatic plant species found in rivers and lakes.

## Recommendations

- Continue monitoring waterbodies within Mississippi for the presence of non-native aquatic plant species.
- Implement early detection, rapid response (EDRR) management options on populations of those non-native aquatic plant species known to be in Mississippi, specifically small isolated populations before they spread to other sites.
- Determine suitable goals for management of large populations of non-native aquatic plant species.
- Implement management strategies on those populations of native species that have grown to nuisance levels in Mississippi waterbodies.

## Acknowledgements

We would like to thank Louis Wasson, Logan Renz, Graham Lightsey, and Olivia Robinson for assistance with plant surveys and collections. We would also like to thank Dr. Victor Maddox (MSU) for assistance with plant identification and Mr. Dennis Riecke (MDWFP) for assistance with waterbody selection. This work was funded by the Mississippi Aquatic Invasive Species Council through Mississippi Department of Environmental Quality from a grant provided by the US Fish and Wildlife Service.

<i>Sabatia calycina</i>	Coastal rose gentian	Nat	1
<i>Sagittaria lancifolia</i>	Bulltongue arrowhead	Nat	6
<i>Sagittaria latifolia</i>	Broadleaf arrowhead	Nat	1
<i>Salix nigra</i>	Black willow	Nat	23
<i>Salvinia minima</i>	Common salvinia	Non-nat	3
<i>Salvinia molesta</i>	Giant salvinia	Non-nat	1
<i>Saururus cernuus</i>	Lizard's tail	Nat	8
<i>Schoenoplectus americanus</i>	Three-square bulrush	Nat	3
<i>Schoenoplectus tabernaemontani</i>	Softstem bulrush	Nat	4
<i>Senna spp.</i>	Senna	-	1
<i>Sesbania herbacea</i>	Bigpod sesbania	Nat	1
<i>Sesbania punicia</i>	Scarlet sesbania	Non-nat	2
<i>Serenoa repens</i>	Saw palmetto	Nat	7
<i>Sideroxylon lanuginosum</i>	Gum bumelia	Nat	1
<i>Sium suave</i>	Water parsnip	Nat	3
<i>Smilax spp.</i>	Greenbriar	Nat	3
<i>Solidago canadensis</i>	Canada goldenrod	Nat	3
<i>Sorghum halepense</i>	Johnson's grass	Non-nat	14
<i>Sparganium americanum</i>	Bur reed	Nat	4
<i>Spartina alterniflora</i>	Smooth cordgrass	Nat	5
<i>Spartina cyosuroides</i>	Big cordgrass	Nat	6
<i>Spartina patens</i>	Saltmeadow cordgrass	Nat	2
<i>Stuckenia pectinata</i>	Sago pondweed	Nat	1
<i>Symphotrichum subulatum</i>	Eastern annual saltmarsh aster	Nat	6
<i>Taxodium distichum</i>	Bald cypress	Nat	9
<i>Tillandsia usneoides</i>	Spanish moss	Nat	1
<i>Triadenum walteri</i>	Greater marsh St. Johnswort	Nat	1
<i>Triadica sebifera</i>	Chinese tallow	Non-nat	7
<i>Toxicodendron radicans</i>	Poison ivy	Nat	1
<i>Typha latifolia</i>	Broadleaf cattail	Nat	3
<i>Ulmus spp.</i>	Elm	Nat	14
<i>Utricularia vulgaris</i>	Common bladderwort	Nat	3
<i>Vallisneria americana</i>	American eelgrass	Nat	5
<i>Vitis spp.</i>	Grape	-	3
<i>Woodwardia areolata</i>	Netted chainfern	Nat	3
<i>Zizaniopsis miliacea</i>	Giant cutgrass	Nat	6

Table 39. Lentic waterbodies surveyed in 2017, 2019, and 2020; an ‘X’ denotes a survey was conducted in that year; waterbodies in **red font** had non-native species present while those in **bold font** had federally or state listed noxious weeds present.
